Description

Core subunit of the mitochondrial membrane respiratory chain NADH dehydrogenase (Complex I) that is believed to belong to the minimal assembly required for catalysis. Complex I functions in the transfer of electrons from NADH to the respiratory chain. The immediate electron acceptor for the enzyme is believed to be ubiquinone.

Application Notes

The stated application concentrations are suggested starting points. Titration of the NADH-ubiquinone oxidoreductase chain 5 antibody may be required due to differences in protocols and secondary/substrate sensitivity.

Immunogen

A portion of amino acids 544-570 from the human protein was used as the immunogen for the NADH-ubiquinone oxidoreductase chain 5 antibody.

Storage

Aliquot the NADH-ubiquinone oxidoreductase chain 5 antibody and store frozen at -20oC or colder. Avoid repeated freeze-thaw cycles.
