### Description

Lymphocytes proliferate and differentiate in response to various concentrations of different antigens. The ability of the B cell to respond in a specific, yet sensitive manner to the various antigens is achieved with the use of low-affinity antigen receptors. This gene encodes a cell surface molecule which assembles with the antigen receptor of B lymphocytes in order to decrease the threshold for antigen receptor-dependent stimulation.

## Application Notes

Titration of the anti-CD19 antibody may be required due to differences in protocols and secondary/substrate sensitivity.

## Immunogen

A portion of amino acids 505-532 from the human protein was used as the immunogen for this anti-CD19 antibody.

## Storage

Aliquot the anti-CD19 antibody and store frozen at -20oC or colder. Avoid repeated freeze-thaw cycles.
