Description

Caspase 9 is an enzyme that in humans is encoded by the CASP9 gene. This gene is part of a family of caspases, aspartate-specific cysteine proteases well studied for their involvement in immune and apoptosis signaling. This protein, the initiator caspase, is activated after cytochrome c release from mitochondria and targets downstream effectors. In mouse, deficiency of this gene can cause perinatal lethality. This protein may have a role in normal brain development. Alternative splicing results in multiple transcript variants that encode different protein isoforms.

Application Notes

Optimal dilution of the Caspase 9 p35 antibody should be determined by the researcher.

Immunogen

Recombinant mouse protein (amino acids E3-D266) was used as the immunogen for the Caspase 9 p35 antibody.

Storage

After reconstitution, the Caspase 9 p35 antibody can be stored for up to one month at 4oC. For long-term, aliquot and store at -20oC. Avoid repeated freezing and thawing.
