## Description

CD162 glycoprotein functions as a high affinity counter-receptor for the cell adhesion molecules P-, E- and L- selectin expressed on myeloid cells and stimulated T lymphocytes. As such, this protein plays a critical role in leukocyte trafficking during inflammation by tethering of leukocytes to activated platelets or endothelia expressing selectins. This protein requires two post-translational modifications, tyrosine sulfation and the addition of the sialyl Lewis x tetrasaccharide (sLex) to its O-linked glycans, for its high-affinity binding activity. Aberrant expression of this gene and polymorphisms in this gene are associated with defects in the innate and adaptive immune response.

## Application Notes

Optimal dilution of the CD162 antibody should be determined by the researcher.

## Immunogen

Recombinant full-length human protein was used as the immunogen for the CD162 antibody.

## Storage

Aliquot the CD162 antibody and store frozen at -20oC or colder. Avoid repeated freeze-thaw cycles.
