Description

This gene encodes a protein that binds to the C-terminus of adenovirus E1A proteins. This phosphoprotein is a transcriptional repressor and may play a role during cellular proliferation. This protein and the product of a second closely related gene, CTBP2, can dimerize. Both proteins can also interact with a polycomb group protein complex which participates in regulation of gene expression during development. Alternative splicing of transcripts from this gene results in multiple transcript variants.

Application Notes

Titration of the CTBP1 antibody may be required due to differences in protocols and secondary/substrate sensitivity.

Immunogen

A portion of amino acids 413-440 from the human protein was used as the immunogen for this CTBP1 antibody.

Storage

Aliquot the CTBP1 antibody and store frozen at -20oC or colder. Avoid repeated freeze-thaw cycles.
