Description

IL-6 is a potent lymphoid cell growth factor that stimulates the growth and survivability of certain B-cells and T-cells. It plays a critical role in B-cell differentiation to plasma cells and is a potent growth factor for plasmacytoma and myeloma. IL-6 is produced by a variety of cell types, including monocytes, fibroblasts and endothelial cells. Upon stimulation, macrophages, T, B, mast, and glial cells, eosinophils, keratinocytes and granulocytes also secrete IL-6. It is involved in

host defense, acute phase reactions, immune responses, and hematopoiesis.

Application Notes

Optimal dilution of the IL-6 antibody should be determined by the researcher.

Immunogen

A recombinant fragment (within amino acids 1-200) of human IL-6 protein was used as the immunogen for the IL-6 antibody.

Storage

Aliquot the IL-6 antibody and store frozen at -20oC or colder. Avoid repeated freeze-thaw cycles.
