Description

Insulin gene enhancer protein ISL-1 is a protein that in humans is encoded by the *isl1* gene. This gene encodes a member of the LIM/homeodomain family of transcription factors. The encoded protein binds to the enhancer region of the insulin gene, among others, and may play an important role in regulating insulin gene expression. The encoded protein is central to the development of pancreatic cell lineages and may also be required for motor neuron generation. Mutations in this gene have been associated with maturity-onset diabetes of the young.

Application Notes

Optimal dilution of the ISL1 antibody should be determined by the researcher.

Immunogen

Amino acids 118-161 (DEFALREDGLFCRADHDVVERASLGAGDPLSPLHPARPLQMAAE) from the human protein were used as the immunogen for the ISL1 antibody.

Storage

After reconstitution, the ISL1 antibody can be stored for up to one month at 4°C. For long-term, aliquot and store at -20°C. Avoid repeated freezing and thawing.
