### Description

Histone-lysine N-methyltransferase NSD3 is an enzyme that in humans is encoded by the WHSC1L1 gene. This gene is related to the Wolf-Hirschhorn syndrome candidate-1 gene and encodes a protein with PWWP (proline-tryptophan-tryptophan-proline) domains. This protein methylates histone H3 at lysine residues 4 and 27, which represses gene transcription. Two alternatively spliced variants have been described.

## **Application Notes**

Optimal dilution of the NSD3 antibody should be determined by the researcher.

## **Immunogen**

Recombinant human protein (amino acids Q46-K1425) was used as the immunogen for the NSD3 antibody.

## **Storage**

After reconstitution, the NSD3 antibody can be stored for up to one month at 4oC. For long-term, aliquot and store at -20oC. Avoid repeated freezing and thawing.
