Description

CD79 (also designated Ig chains, designated CD79B or B29. The B cell antigen receptor complex (BCR) is formed by the association of CD79 with a membrane immunoglobulin, such as IgM or IgD. The membrane immunoglobulins IgM and IgD achieve surface expression and antigen presentation function in response to CD79 association. The cytoplasmic tails of both CD79A and CD79B contain an ITAM (immuno-receptor tyrosine-based activation) motif, which acts to initiate the

BCR signaling reactions by binding to and activating tyrosine kinases.

Application Notes

Optimal dilution of the recombinant CD79b antibody should be determined by the researcher.

Immunogen

A portion of amino acids 29-159 was used as the immunogen for the recombinant CD79b antibody.

Storage

Aliquot the recombinant CD79b antibody and store frozen at -20oC or colder. Avoid repeated freeze-thaw cycles.
