Description

MDM2 is a nuclear phosphoprotein that binds and inhibits transactivation by tumor protein p53. It can promote tumor formation by targeting tumor suppressor proteins, such as p53, for proteasomal degradation. Overexpression of MDM2 can result in excessive inactivation of tumor protein p53, diminishing its tumor suppressor function. This protein also affects the cell cycle, apoptosis, and tumorigenesis through interactions with other proteins, including retinoblastoma 1

and ribosomal protein L5. Overexpression of MDM2 protein is detected in a variety of cancers.

Application Notes

Optimal dilution of the recombinant MDM2 antibody should be determined by the researcher.

Immunogen

A portion of amino acids 126-254 was used as the immunogen for the recombinant MDM2 antibody.

Storage

Aliquot the recombinant MDM2 antibody and store frozen at -20oC or colder. Avoid repeated freeze-thaw cycles.
