Description

Alpha actinins belong to the spectrin gene superfamily which represents a diverse group of cytoskeletal proteins, including the alpha and beta spectrins and dystrophins. Alpha actinin is an actin-binding protein with multiple roles in different cell types. In non-muscle cells, the cytoskeletal isoform is found along microfilament bundles and adherens-type junctions, where it is involved in binding actin to the membrane. In contrast, skeletal, cardiac, and smooth muscle isoforms are localized to the Z-disc and analogous dense bodies, where they help anchor the myofibrillar actin filaments. This gene encodes a muscle-specific, alpha actinin isoform that is expressed in both skeletal and cardiac muscles. Several transcript variants encoding different isoforms have been found for this gene.

Application Notes

Optimal dilution of the Sarcomeric Actinin Alpha 2 antibody should be determined by the researcher.

Immunogen

A portin of amino acids 557-692 from the human protein was used as the immunogen for the Sarcomeric Actinin Alpha 2 antibody.

Storage

Aliquot the Sarcomeric Actinin Alpha 2 antibody and store frozen at -20oC or colder. Avoid repeated freeze-thaw cycles.
