## Description

The modification of proteins with ubiquitin is an important cellular mechanism for targeting abnormal or short-lived proteins for degradation. Ubiquitination involves at least three classes of enzymes: ubiquitin-activating enzymes, or E1s, ubiquitin-conjugating enzymes, or E2s, and ubiquitin-protein ligases, or E3s. This gene encodes a member of the E2 ubiquitin-conjugating enzyme family. Four alternatively spliced transcript variants encoding the same protein have been found for this gene.

## Application Notes

Titration of the UBC9 antibody may be required due to differences in protocols and secondary/substrate sensitivity.

## Immunogen

This UBC9 antibody was raised using purified GST-UBC9 fusion protein.

## Storage

Aliquot the UBC9 antibody and store frozen at -20oC or colder. Avoid repeated freeze-thaw cycles.
