

Zebrafish Nanos3 Antibody / Nanos homolog 3 (RZ1245)

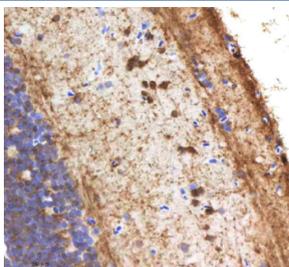

Catalog No.	Formulation	Size
RZ1245	0.5mg/ml if reconstituted with 0.2ml sterile DI water	100 ug

Bulk quote request

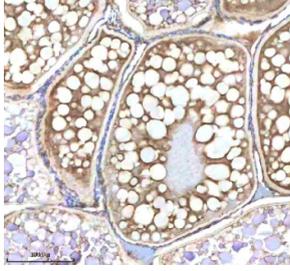

Availability	2-3 weeks
Species Reactivity	Zebrafish
Format	Antigen affinity purified
Host	Rabbit
Clonality	Polyclonal (rabbit origin)
Isotype	Rabbit Ig
Purity	Antigen affinity chromatography
Buffer	Lyophilized from 1X PBS with 2% Trehalose
UniProt	Q90WW1
Localization	Cytoplasm
Applications	Immunohistochemistry (FFPE) : 2-5ug/ml
Limitations	This Zebrafish Nanos3 antibody is available for research use only.

Zebrafish Nanos3 Antibody Pancreas Tissue IHC. Immunohistochemistry staining of zebrafish Nanos3 protein using Zebrafish Nanos3 antibody, HRP-labeled secondary and DAB substrate. Nanos3 was detected in a paraffin-embedded section of zebrafish pancreas tissue. HIER: boil tissue sections in pH8 EDTA for 20 min and allow to cool before testing.

Zebrafish Nanos3 Antibody Brain Tissue IHC. Immunohistochemistry staining of zebrafish Nanos3 protein using Zebrafish Nanos3 antibody, HRP-labeled secondary and DAB substrate. Nanos3 was detected in a paraffin-embedded section of zebrafish brain tissue. HIER: boil tissue sections in pH8 EDTA for 20 min and allow to cool before testing.

Zebrafish Nanos3 Antibody Ovary Tissue IHC. Immunohistochemistry staining of zebrafish Nanos3 protein using Zebrafish Nanos3 antibody, HRP-labeled secondary and DAB substrate. Nanos3 was detected in a paraffin-embedded section of zebrafish ovary tissue. HIER: boil tissue sections in pH8 EDTA for 20 min and allow to cool before testing.

Description

The Zebrafish Nanos3 antibody targets Nanos3, a highly conserved RNA-binding protein essential for germ cell specification, migration, survival, and early reproductive lineage development in *Danio rerio*. Zebrafish, also known as *Danio rerio*, express *nanos3* as one of the earliest determinants of primordial germ cells (PGCs), with expression beginning maternally and persisting in PGCs as they migrate toward the developing gonad. Nanos3 localizes to the cytoplasm, particularly within ribonucleoprotein granules, where it represses translation of target mRNAs to maintain germ cell identity and prevent precocious differentiation.

Nanos3 belongs to the *nanos* family of translational repressors, characterized by two CCHC-type zinc finger motifs that bind RNA and regulate stability and translation of germ cell-associated transcripts. In zebrafish embryos, *nanos3* mRNA is inherited maternally and segregates specifically to PGCs through germ plasm determinants. A Zebrafish Nanos3 antibody is suitable for research applications examining cytoplasmic expression in migrating and differentiating PGCs, enabling high-resolution mapping of germ cell lineage dynamics during early development.

Functionally, Nanos3 is indispensable for germ cell survival. It protects PGCs from apoptosis during their long-range migration across the embryo and ensures these cells reach the gonadal ridges. Nanos3 accomplishes this by repressing transcripts that promote somatic differentiation and by regulating signaling pathways controlling motility and guidance cues. In zebrafish, *nanos3*-deficient embryos exhibit PGC loss, disrupted migration routes, and failure to establish germline progenitors. Because PGC behavior is highly visible in transparent zebrafish embryos, Nanos3 serves as a central marker for studying germ cell development, stem cell maintenance, and reproductive axis formation.

Structurally, zebrafish Nanos3 contains conserved zinc finger motifs responsible for RNA binding and translational repression. These domains allow interaction with germ plasm components, mRNA targets, and co-factors that regulate RNA stability. Zebrafish *nanos3* maps to chromosome 13, with maternal and zygotic regulatory elements ensuring selective expression in germ cell lineages. Co-localization studies frequently detect Nanos3 within germ plasm-associated structures, migrating PGC clusters, and developing gonadal tissues, often overlapping with markers such as *vasa*, *dnd1*, and *tldr* family proteins.

A Zebrafish Nanos3 antibody is suitable for detecting Nanos3 in studies focused on germ cell specification, migration, survival pathways, and reproductive lineage development in *Danio rerio*. Its cytoplasmic labeling provides insight into PGC dynamics, enabling researchers to trace germ cell routes, analyze mutants affecting chemotaxis or germ plasm assembly, and examine molecular mechanisms that safeguard germline identity. Nanos3 is also valuable in studies of fertility, reproductive toxicology, and developmental stem cell biology. These properties make the antibody a key tool for understanding early reproductive development and germ cell regulatory networks, and it is supplied for research use by NSJ Bioreagents.

This Zebrafish antibody is part of a [broader Zebrafish / *Danio rerio* antibody panel](#) offered by NSJ Bioreagents.

Application Notes

Optimal dilution of the Zebrafish Nanos3 antibody should be determined by the researcher.

Immunogen

E. coli-derived zebrafish Nanos3 recombinant protein (amino acids M1-W159) was used as the immunogen for the Zebrafish Nanos3 antibody.

Storage

After reconstitution, the Zebrafish Nanos3 antibody can be stored for up to one month at 4°C. For long-term, aliquot and store at -20°C. Avoid repeated freezing and thawing.
